Project Exam 1

Martin Kruger

Word count

310

Design

What went well on the project

I wanted to focus on the code for the project and not be overburdened by the design so I chose to go with a basic design.

This made it easier to implement the design in the project, and allowed me to spend more time focusing on more complex code.

What was difficult/didn't go well on the project

My design is possibly now a bit too minimalist.

What would you do differently next time

I would probably spend a bit more time on the design.

Technical

What went well on the project

I feel the code was well implemented and all of the technical objectives were met.

I enjoyed working with the project and found the content assisted me with building out the project.

What was difficult/didn't go well on the project

I experimented with a positioning files in the types of files, such as all the pages together, all the styles together etc.

I feel this would have gone better if I co-located the files.

What would you do differently next time

I would colocate the files so that it was easier to work with the different parts of the site.

WCAG guidelines, content management and SEO

What went well on the project

I used semantic elements to assist with WCAG. The content was hosted on a headless WordPress installation making it easy to add SEO content. I added titles and descriptions to

assist with the SEO. I also tracked the page with HotJar to test the user experience.

What was difficult/didn't go well on the project

I didn't add Google Analytics.

What would you do differently next time

I would probably add Google Analytics to get better analytics of the users.

References

(place references to websites, books, forums etc. that helped you in the project)
